LOVEDetect ENABLES USERS TO DISCOVER THE TRUTH ABOUT LOVE

Wilmington, DE, September 29, 2006 Lovedetect.com proudly announces the recent release of a brand new voice analysis service combined with a pre-paid telephone calling card that allows users to determine their love interests' true feelings. From the makers of [Spooftcard](#) this one of a kind service gives users access to patented 3rd generation voice analysis technology developed by Israeli security company Nemesysco Ltd.

LoveDetect provides an added layer of security to single women, or anyone else, who feels the need to make sure the person they are (or about to be) involved with romantically really loves them. Although currently this technology is considered "for entertainment use only", its roots are [Nemesysco's](#) patented voice analysis technology currently used around the world by various security agencies including airport security and law enforcement agencies.

"We are pleased to announce the introduction of a new type of voice analysis technology combined with a simple to use pre-paid calling card which is over 90% accurate" said TelTech CTO Eli Finkelman. We feel strongly our latest product really helps people to discover if the person they are in love with loves them back or might possibly harbor other less desirable ulterior motives. Plus, some people just find it fun to analyze their significant other's love quotient."

Although this type of voice analysis technology has been used for many years behind the scenes by law enforcement agencies and insurance agencies among others, this is the first time it's been offered to the general public in the USA. Utilizing poly-layer voice analysis, this software processes the voice patterns of the person the user calls. By running those patterns through 8,000 different algorithms, 129 different aspects of the sounds are measured. The final result is an "emotional signature" unique to the individual speaker.

The report summarizing the emotional signature analysis can be retrieved in one of three ways. A powerful web based control panel allows the caller to view the graph of the conversation in real time. This gives the ability to pinpoint moments during the conversation where the excitement level jumps up, for example. Not only that, an archive of past calls and their results remain available to the caller for review at any time. Or you can simply remain on the line after the other person hangs up and receive a verbal report immediately.

TelTech LLC is dedicated to developing innovative calling card products real people can use to make their lives better, safer, more fulfilled, and fun. TelTech is adding Love Detect to their Prepaid 2.0 suite of products as time. Further information can be found at LoveDetect.com or by contacting the company at Media@LoveDetect.com
